Update on Global Warming

There are at least two schools of thought regarding the issue of global warming. One possible school includes what might be called the “Computer Geeks” and another includes what could be called the “Gauge Readers.” Since the presenter is a Mechanical Engineer, that puts him in the “Gauge Reader” camp. His presentation will include a variety of gauge readings for features such as solar activity, air and ocean temperatures, carbon dioxide levels, vegetation, and sea ice. He believes that the science underlying some of the alarmists and the Kyoto Agreement has many flaws. His own research shows a major flaw in one of pertinent computer programs. He strongly disagrees with the alarmists about global warming.
