HNEI PakaLi Battery Laboratory

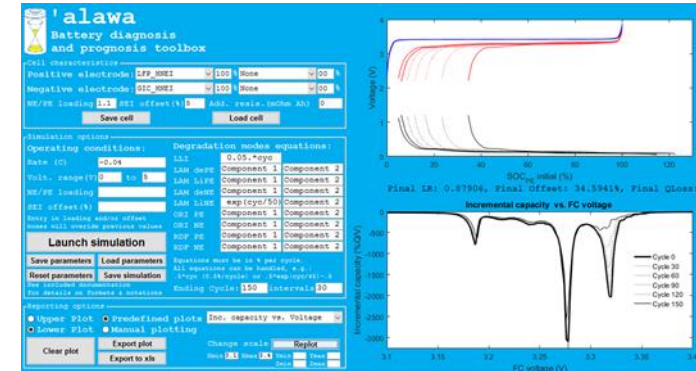

Diagnosis and Prognosis

Well defined performance metrics

Experience in experimental design

Operando Diagnosis and prognosis

Non-destructive analysis

Online SOC and SOH monitoring

New methodologies for deployed systems

Large storage systems modeling

Account for cell-to-cell variations

Transfer knowledge from single cell to packs

Applications to commercial batteries

BESS

V2X / X2V

Second use, Recycling (To be started)

Hawaii Clean Energy Initiative

Battery powered transportation in Hawaii

Battery systems will be essential for the Hawaii Clean Energy Initiative

The Hawaii Clean Energy Initiative is leading the way in relieving our dependence on oil by setting goals to achieve 100% clean energy and transportation by 2045.

Battery Energy
Storage Systems
(BESS)

Need to increase penetration of renewables
BUT Intermittency:

- Need to store the excess renewable energy
- Need to stabilize the grid

Batteries are most likely candidates:

- Fast response
- Efficiency > 95%,
- Plug and play installation
- Can be distributed at strategic locations

Battery powered electric
vehicles (EV)

Reduce further oil consumption
Reduce emissions
Additional storage for the grid

Hawaii Clean Energy Initiative

Battery powered transportation in Hawaii

4

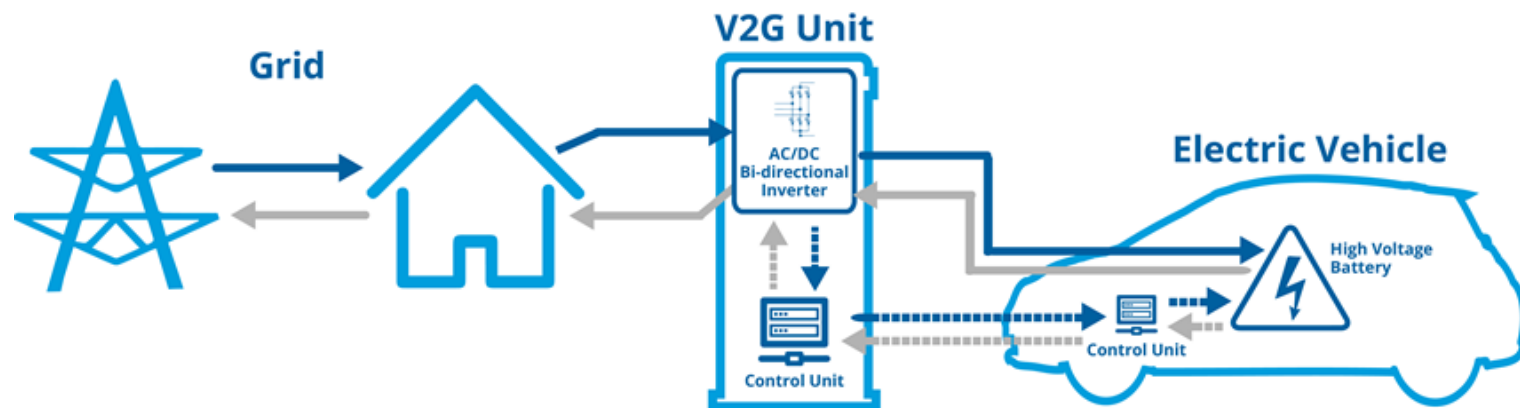

Hawaii grid storage (as of 2017) ~ 40 MW & 30 MWh

Hawaii total EVs > 10000: >500 MWh of potential storage

Forecast: between 100,000 and 250,000 in 2040 (M. Coffman, UHERO)

5000 MWh to 25000 MWh of potential storage

Vehicle to grid (V2G)

Battery second use

Use of used EV batteries (>20% capacity loss) for grid storage

The complexity of battery diagnosis

Path dependence of the degradation

Traffic

Road type

Driving habits

Charging habits

Temperature

Grid ties (V2G / G2V)

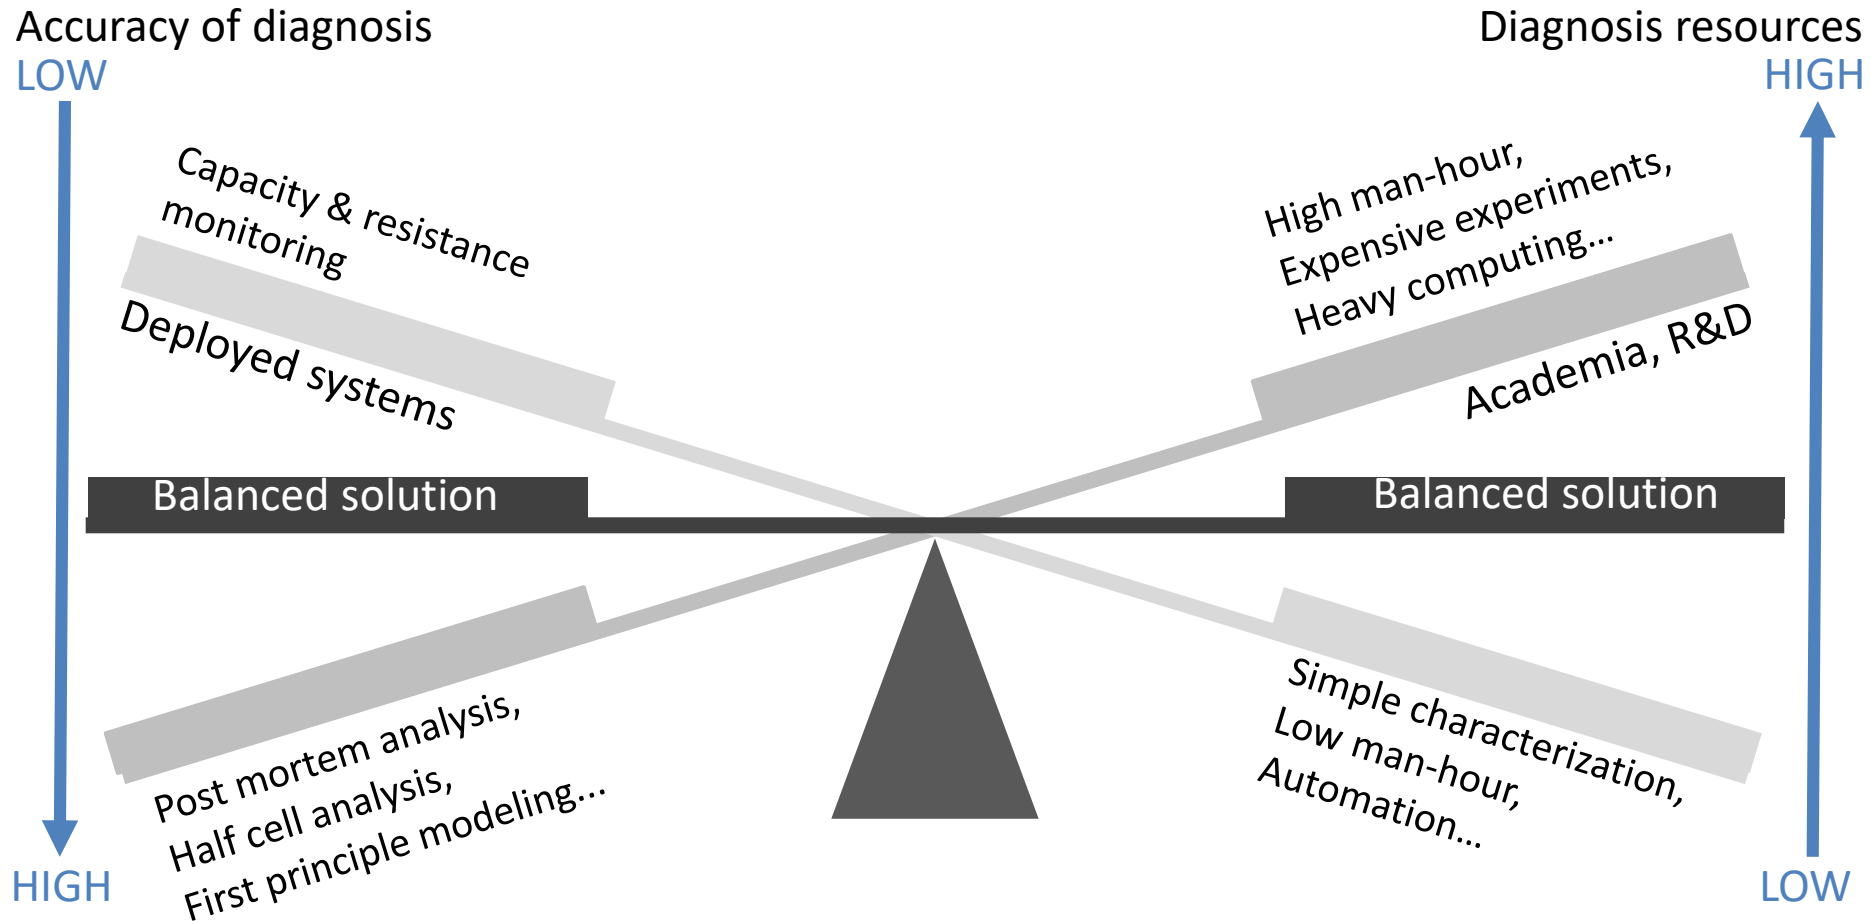

Different paths will lead to different degradation

Every battery is different

HNEI developed accurate diagnosis using onboard parameters

The complexity of battery diagnosis

Complex balance

Battery Diagnosis Diagnosis to Prognosis

We then use that knowledge to predict what will happen to the cell

To understand the degradation from a material stand point

We study voltage variations

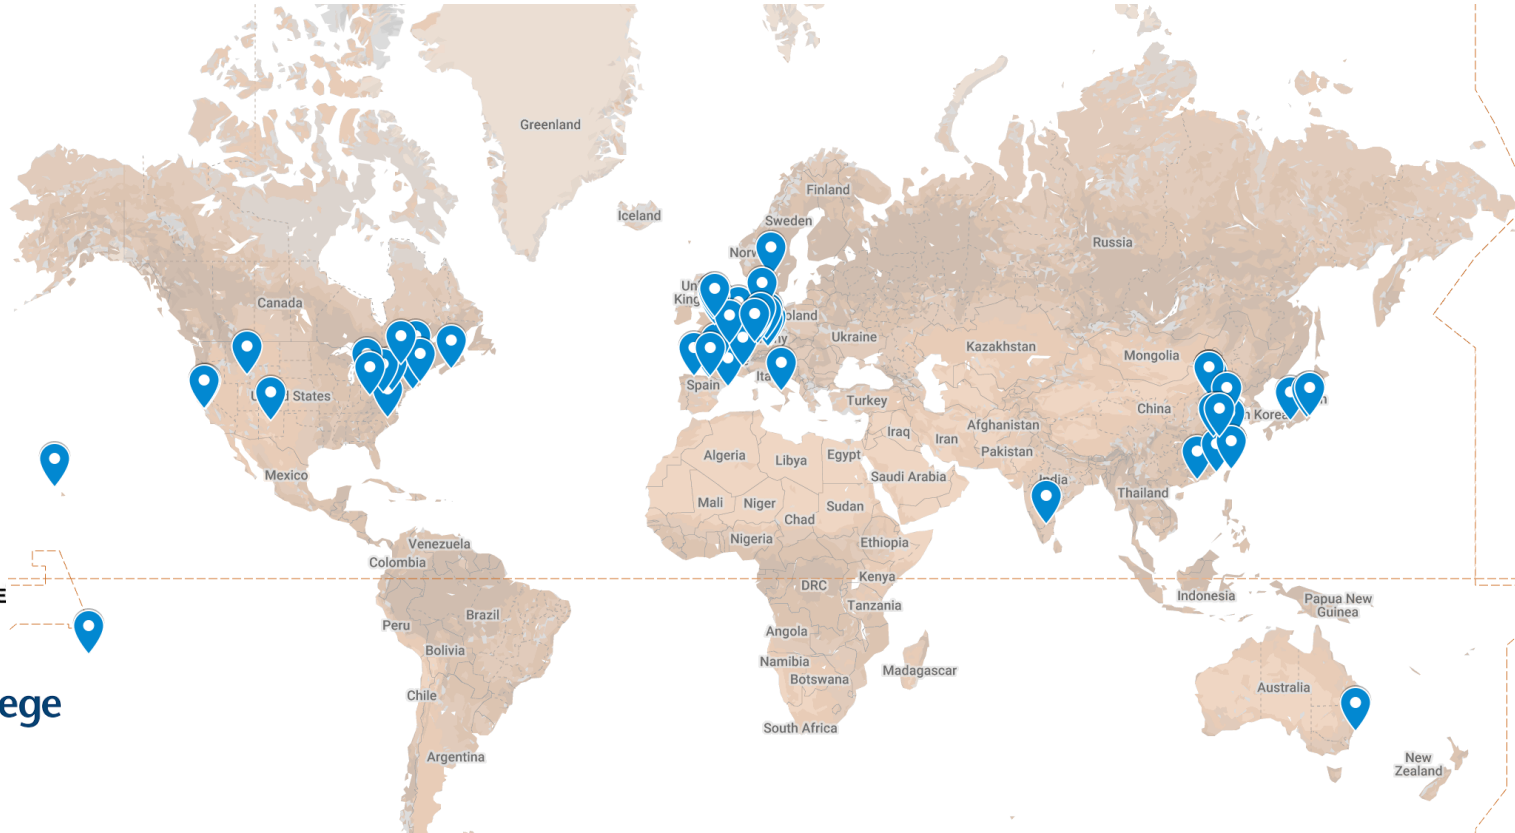

LAM_{NE}: loss of negative electrode material
LLI: Loss of lithium inventory

Mechanistic diagnosis and prognosis HNEI methodologies

100 registered users from >50 organizations worldwide

HNEI PakaLi Battery Laboratory

Recent focus on batteries for storage, grid-tied or in vehicles

Grid-tied Storage

Monitoring of 3 grid-tied systems
($\geq 1\text{MW}$)

Laboratory testing of single cells
(similar to the one in large batteries)
> 80 battery tested under different conditions

Vehicle Storage

Study impact of vehicle to grid
usage on EV battery degradation

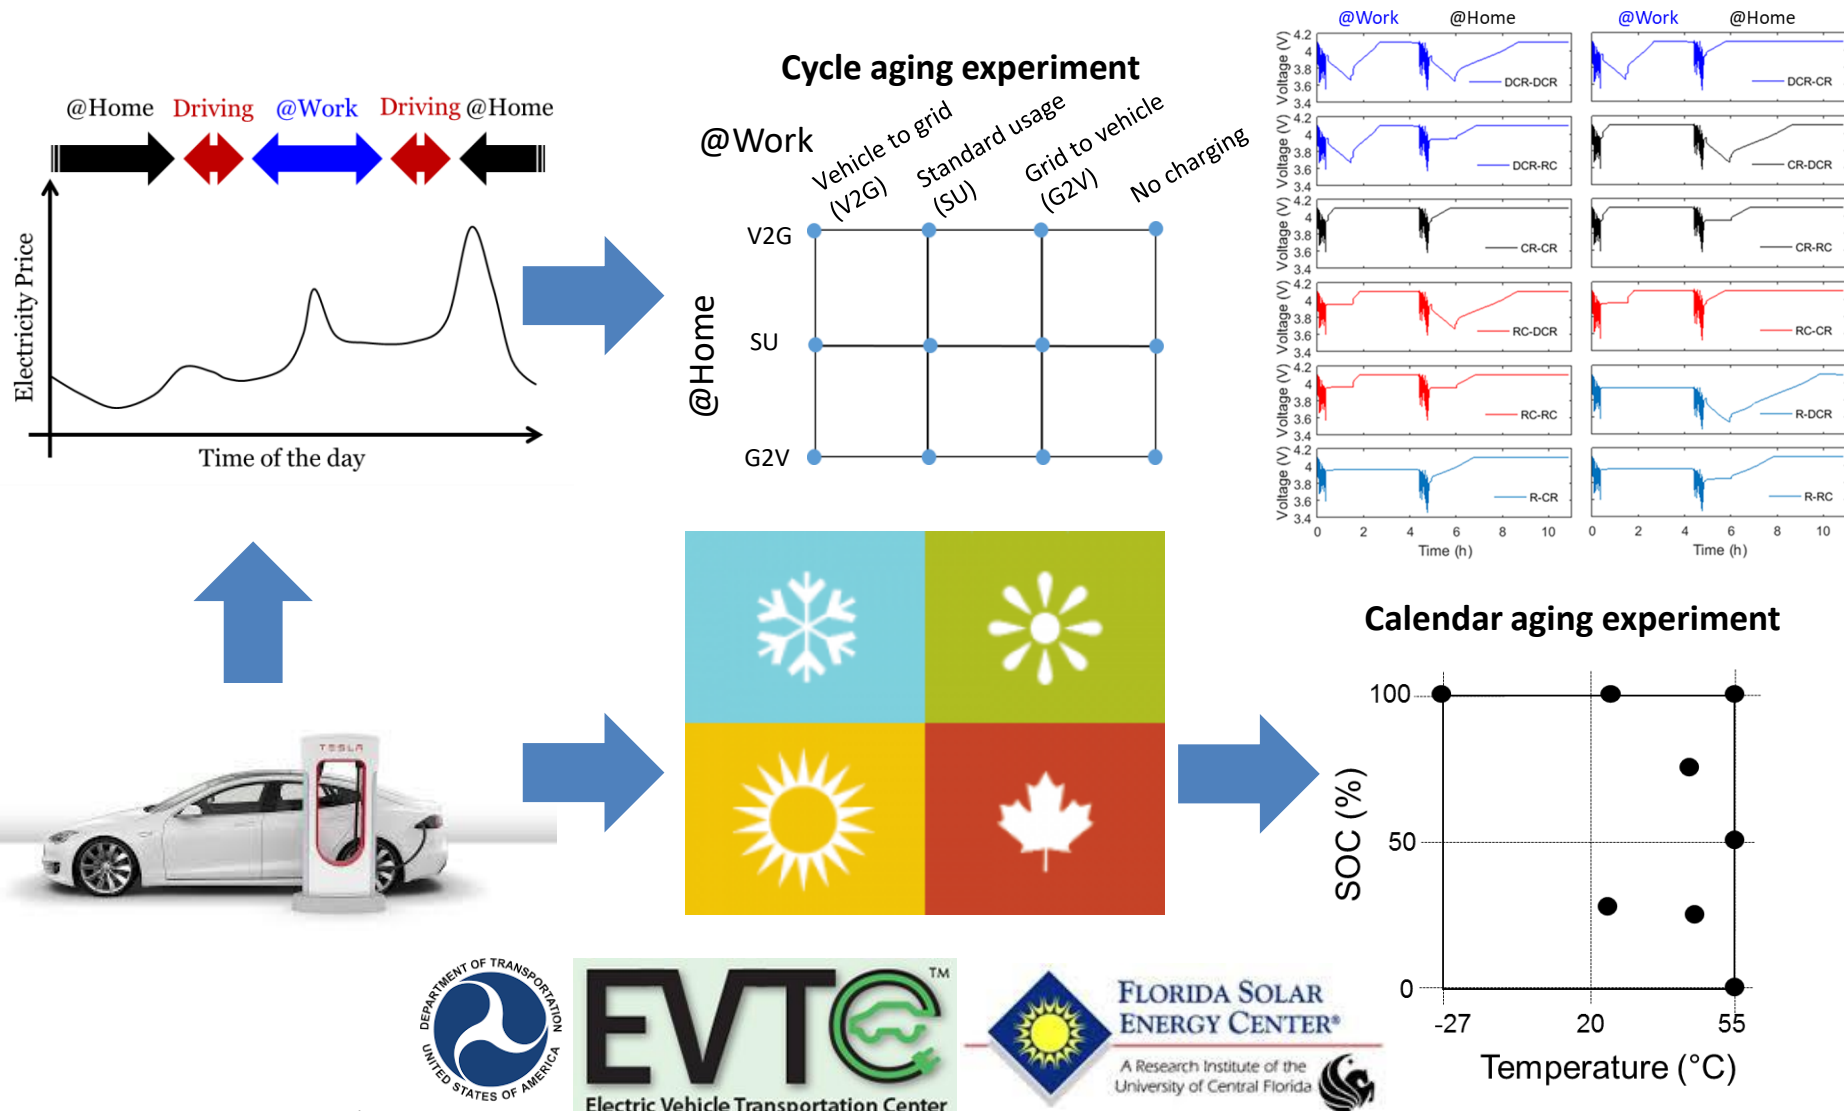

Laboratory testing of single cells
(similar to the one in EVs)
> 100 battery tested under different conditions

EV Cell Degradation under Electric Utility Grid Operations

Design of experiment methodology: cycle and calendar aging

EV Cell Degradation under Electric Utility Grid Operations

Cycle aging experiment

Results:

V2G 2x1h/day @ P/4 : +75% capacity loss

V2G 1h/day @ P/4 : +33% capacity loss

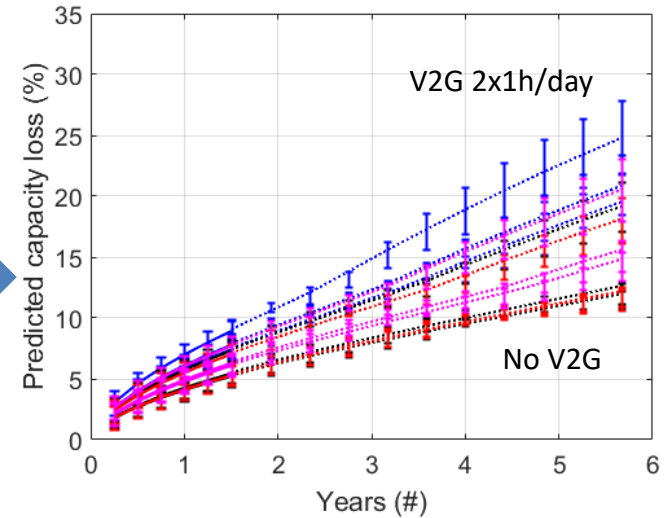

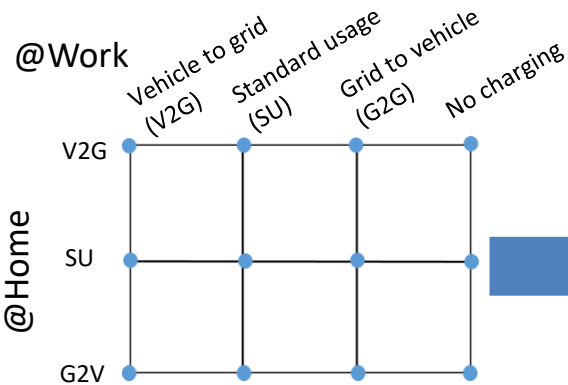

Charging 2x/day vs. 1x/ day: -5% capacity loss

SU vs. G2V : no significant effect

Prognosis:

V2G strategy drastically reduces durability

G2V might be beneficial in warm climates

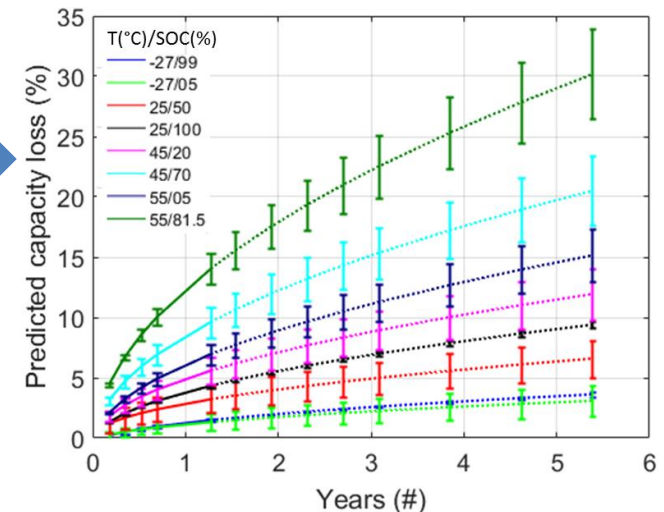

Calendar aging experiment

Results:

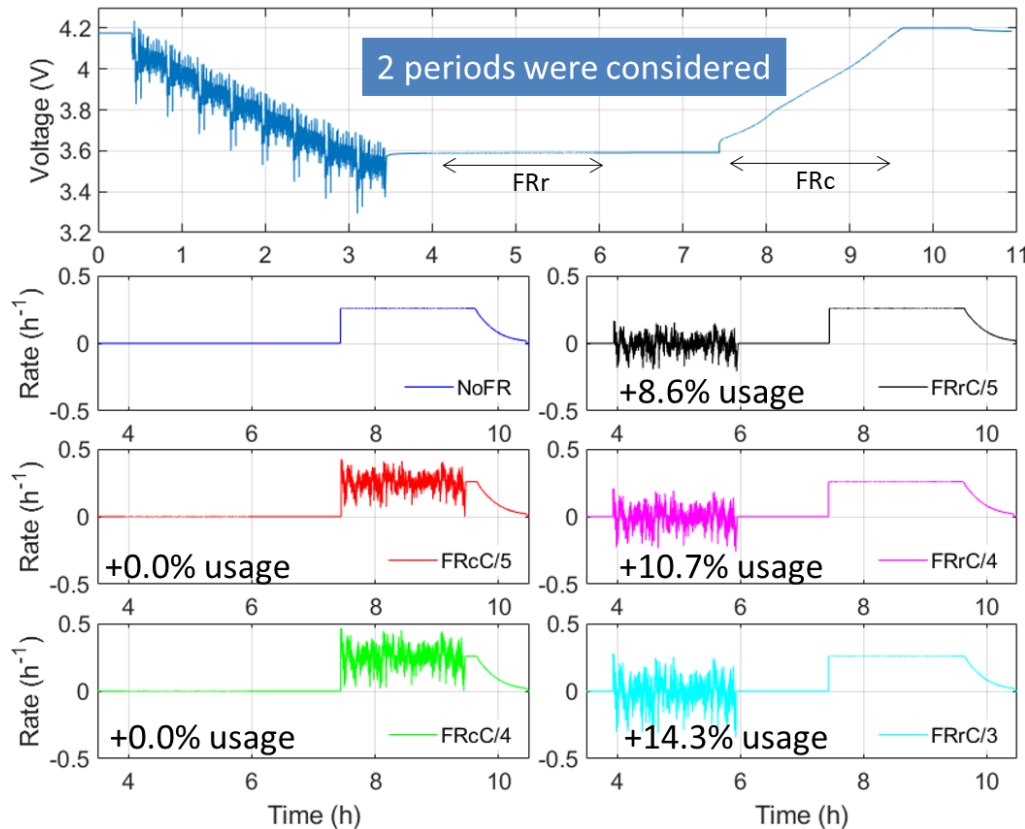

Significant effect of time, temperature and SOC.

Temperature effect > SOC effect at high values

Impact of Frequency Regulation Usage on Cell Degradation

Study the impact of frequency regulation usage

Baure et al. / Energies, 13 (10) 2494 (2020) doi: 10.3390/en13102494

V2G could be beneficial to utility and EV owner
but only with proper control and understanding of battery degradation

Acknowledgments

My students, especially Arnaud Devie and Cyril Truchot
