Temperature-dependent Electrochemistry in Li-ion Batteries

- Modern Li-ion batteries consist of a graphite anode, metal oxide cathode, and an electrically insulating ۲ separator soaked with an organic solvent-based electrolyte
- Li-ion electrochemistry and lithium morphology are heavily dependent on local thermal conditions ٠

Palacín & de Guibert, Science, 2016

Application and Measurement of Interelectrode Thermal Gradient (ITG)

- Instrumented coin cells to enable local temperature measurement at each electrode
- Applied a thermal gradient using two heat exchanger plates

Carter, Kingston, Atkinson, Parmananda, Dubarry, Fear, Mukherjee, and Love, Directionality of thermal gradients in lithium-ion batteries dictates diverging degradation modes, *Cell Reports Physical Science*, 2021, 2(3) 100351. DISTRIBUTION A. Approved for public release: distribution unlimited.

ITG Design of Experiments

- NMC/graphite coin cells
- Investigate the effect of:
 - Thermal average: 20, and 35 °C
 - ITG: -2, 0, 2 °C
- Perform galvanostatic cycling at C/5 for 20 cycles
 - Voltage limits: 3.0 and 4.3 V
 - Current: 0.74 mA

Simulated Degradation Modes

- Simulated modes of degradation are used to identify the experimentally observed degradation modes using IC analysis
- Primary degradation modes:
 - A: Loss of lithium inventory (LLI)
 - B: Loss of active material at positive electrode (LAM at PE)
 - C: Loss of active material at negative electrode (LAM at NE)
- Mixed degradation modes:
 - D: LLI + LAM at PE
 - E: LLI + LAM at NE

See Dubarry, Truchot, and Liaw (2012) JPS for additional details regarding IC simulation

Identifying Degradation Modes Using Incremental Capacity Analysis

 Compare experimental IC curves to simulated ones with explicit degradation modes

- Conclusion:
 - Directionality of thermal gradient dictates which electrode is prone to failure
 - Rapid, negative electrode degradation with Li plating for $\Delta T_{int} = -2$ °C
 - Gradual, positive electrode degradation for ΔT_{int} =+2 °C

Carter, Kingston, Atkinson, Parmananda, Dubarry, Fear, Mukherjee, and Love, Directionality of thermal gradients in lithium-ion batteries dictates diverging degradation modes, Cell Reports Physical Science, 2021, 2(3) 100351.

IOWA STATE UNIVERSITY Department of Mechanical Engineering

Post-mortem Optical Analysis and EIS

- Plated Li identifiable in optical images •
- Large shift in EIS response for cells cycled at $\Delta T_{int} = -2$ °C •

Electrochemical Behavior at Ambient Temperatures

• Cells cycled at an ambient thermal average (20 °C) had no degradation

Carter, Kingston, Atkinson, Parmananda, Dubarry, Fear, Mukherjee, and Love, Directionality of thermal gradients in lithium-ion batteries dictates diverging degradation modes, Cell Reports Physical Science, 2021, 2(3) 100351. DISTRIBUTION A. Approved for public release: distribution unlimited.

Department of Mechanical Engineering

Primary Takeaways

- Li-ion electrochemistry is dependent on ITGs
- Subjecting Li-ion cells to a warm, ITGs degrades the cell relative to isothermal conditions
- Directionality of the ITG dictates the degradation mode
- Accelerated aging of Li-ion cells can accomplished by applying an ITG
- Improved thermal management strategies are needed to ensure safe and reliable operation of Li-ion batteries
