Project Team

Principal Investigator: Makena Coffman, PhD Economics

Makena Coffman is an Assistant Professor of Urban and Regional Planning, University of Hawaii at Manoa. She teaches graduate courses in environmental planning related to climate change mitigation and adaptation in the Asia/Pacific Region; energy policy; planning methods; and environmental valuation. She specializes in economic-environment modeling, holds a B.A. in international relations from Stanford University and a Ph.D. in economics from the University of Hawaii at Manoa. She is a Research Associate with University of Hawaii Economic Research Organization and Affiliate Faculty with the Public Policy Center UHM.

Paul Bernstein, PhD Operations Research

Paul Bernstein is a Principal at Charles River Associates. He specializes in developing economic models applied to such diverse fields as climate change policy, alternative-fueled vehicles, fuel markets, auctions, and electricity generation. He holds a B.A. in mathematics and physics from U.C. San Diego and a Ph.D. in operations research from Stanford University.

Aaron Mann, Masters Candidate, Urban and Regional Planning UHM

Aaron Mann is a Research Assistant with the University of Hawaii Economic Research Organization. He is studying land-use and environmental planning with specific focus on conservation easements.

Model Update

The July 30, 2010 preliminary report on model development outlined the Hawaii Computable General Equilibrium (H-CGE) and Hawaii Electricity Model (HELM) developed for this project. The models presented preliminary output for the baseline calibration. The link from H-CGE to HELM (the electricity forecast demand) was presented and, currently, the link from HELM to H-CGE (overall economy impacts of various energy portfolios) is under development.

In addition, the HELM dataset largely consisted of “placeholders” within the July Report. The dataset has been updated with publicly available sources and is “complete” in the sense that it is ready for stakeholder review.

Scenario Analysis

While H-CGE and HELM can be developed to address a wide variety of energy policy scenarios, given the adoption by the Hawaii State Legislature of a more stringent Renewable Portfolio Standard (RPS) targets and the exclusion of energy efficiency from the RPS with the creation of the Energy Efficiency Portfolio Standard (EEPS), the study team will assess the optimal energy technology selection to achieve 40% renewable energy by the year 2030. This work will serve as a baseline by which to later address the EEPS (potentially next year’s scope of work).

The RPS will be modeled within HELM based on the constraints of two regulated electric utilities in the state: one operating solely on the island of Kauai (KIUC) and the other operating on all other islands (HECO, MECO, and HELCO).

The scenario will be assessed under 1) the case that an undersea cable is built connecting Maui County to the City & County of Honolulu, and 2) that each island has an isolated grid system. Within the “cable scenario,” installation costs will be reflected through amortized “loan payback” by taxpayers. Thus, the macroeconomic impacts of the cable, as well as the renewable energies that it allows (i.e. greater wind penetration) will be accounted for within the model.
